

Flash Paper, Flash Cotton and Flash Cord

1. Flash Paper, Flash Cotton and Flash Cord are nitrated products. They have been processed with concentrated Nitric and Sulphuric acids to form a modified paper which will rapidly burn with no smoke if ignited when dry.
2. Flash Paper, Flash Cotton and Flash Cord are not restricted materials **provided** that they have been provided supplied wetted with either water or alcohol. They are flammable solid materials in this condition and are not covered by explosive regulations. This is why they are supplied in sealed polythene bags.

Flash Paper, Flash Cotton and Flash Cord must always be in a wet condition for transportation purposes.

3. Wet Flash Paper, Flash Cotton and Flash Cord should be stored in a suitable lidded container, away from heat or ignition sources, in a further box of cupboard or room, with no public access. Flash Paper, Flash Cotton and Flash Cord that has been dried prior to use may be kept in a separate lidded container, again away from heat or ignition sources, but not more than the content of one polythene bag at a time.
4. On no condition should dried Flash Paper, Flash Cotton and Flash Cord be kept in bulk, as it could probably, if ignited, cause either, at best, a massive fire hazard, or at worst, a massive explosion hazard.
